

Seasonal Boost Package

This Seasonal Boost Treatment package with liquid and dry bacteria will help maintain ponds in the fall or spring when water temps are below 55° F. The safe, effective and natural enzyme producing bacteria in these products help break down leaves and other organic debris. Applications in the fall will help to winterize a pond for its dormant phase. Applications in the spring will help to jump start the summer treatment of your pond.

Instructions for use

Use when pond temperatures drop below 55° F to as low as 38° F. EasyPro Seasonal Boost Bacteria (liquid) and Sludge Remover Bacteria (dry) can be used year round, but recommended dosages are designed for water below 55° F.

NOTE: It is recommended to turn off UV lights (if used) for at least 24 hours after application. Use of algacides at the same time can limit effectiveness.

Application

The liquid product can be measured and poured into the pond. The dry, water soluble packets can be tossed into the pond by hand. Placement of products may be varied if desired.

Dosages

- Due to a wide range of pond conditions and needs, recommended dosage rates can be adjusted accordingly
- If your pond freezes over in the winter, treatment may be discontinued during this time
- To calculate approximate pond volume: Pond Length x Width x Average Depth x 7.48 = gallons

Nine Week Consecutive Treatment Option

500 gal. pond (SBK16)	Initial Dose	2	3	4	5	6	7	8	9
SWT Liquid (ounces)	3	1.5	1.5	1.5	1.5	1.5	1.5	1.5	1.5
